

AI integration checklist

Prioritized controls derived from a real audit; business-specific instructions removed.

Sanitized from a real production audit. Identifying business information and competitor names were removed; retained numeric engineering metrics are unchanged unless explicitly noted.

1. Make the entity explicit

1. Publish a consistent organization identity in visible copy and structured data.
2. Connect services, locations and proof points to that entity.
3. Keep names and identifiers consistent across first-party profiles.
4. Record source URLs and timestamps for every implementation claim.

Acceptance check: Each published fact resolves to a current first-party source.

2. Close measured query gaps

1. Map priority query types to relevant service or decision pages.
2. Answer urgent and problem-based intents directly and factually.
3. Add comparison evidence without unverified superlatives.
4. Measure the same query battery again after implementation.

Acceptance check: Content changes are traceable to query-type evidence and can be re-audited.

3. Validate before publishing

1. Run schema and link checks.
2. Review every claim status; reject unsupported or forbidden wording.
3. Preserve the package hash, manifest and validation result.
4. Keep signing-key verification separate from factual claim validation.

Acceptance check: Release artifacts only after the validation result is recorded.

The original Stage H checklist passed with 0 errors and 3 warnings in both saved artifact languages.
